University of Kentucky

A scattering map in two dimensions

## Resumen:

We consider the scattering map introduced by Beals and Coifman and Fokas and Ablowitz that may be used to transform one of the DaveyStewartson equations to a linear evolution. We give mapping properties of the scattering transform on weighted  $L^2$  Sobolev spaces that mimic well-known properties of the Fourier transform. This is joint work with Katharine Ott, Peter Perry, and Nathan Serpico.
